

## Task 1: Student Information System

**Objective:** Understand class and object creation.

**Task:**

- Create a `Student` class with variables: `rollNo`, `name`, `marks`
  - Create a **constructor** to initialize values
  - Create a method `display()` to show student details
  - Create at least **2 objects** in `main()` and display their data
- 

## Task 2: Bank Account Using Constructor

**Objective:** Learn parameterized constructor usage.

**Task:**

- Create a `BankAccount` class
  - Data members: `accountNo`, `holderName`, `balance`
  - Use a **parameterized constructor**
  - Create methods: `deposit()` and `withdraw()`
  - Create object and perform deposit & withdraw operations
-

### Task 3: Employee Salary Calculation

**Objective:** Use constructor and class methods.

**Task:**

- Create an `Employee` class
  - Variables: `empId`, `empName`, `basicSalary`
  - Constructor initializes values
  - Method `calculateSalary()` adds HRA (20%) and DA (10%)
  - Method `displaySalary()`
  - Create an object and show total salary
- 

### Task 4: Book Management System

**Objective:** Practice multiple objects with constructor.

**Task:**

- Create a `Book` class
  - Variables: `bookId`, `bookName`, `author`
  - Use constructor to initialize book details
  - Create method `showBook()`
  - Create **3 book objects** and display all details
-

## Task 5: Rectangle Area Using Default Constructor

**Objective:** Understand default constructor.

### Task:

- Create a `Rectangle` class
- Variables: `length`, `width`
- Use a **default constructor** to set values
- Create method `calculateArea()`
- Create object and print area of rectangle
